Retrospective Sprint 5

Supervisor: David Gregory

What was done?

This sprint started of with a revision of our ETL. This was needed because a lot of the functionality we wanted (and needed) automated would not work in the previous setup. Version 2 is 99% done and lots of performance and stability issues have been addressed. It is now also possible to setup CouchDB from scratch to make sure that all databases exists before any data fetching is scheduled.

Unified colour palettes and fonts have been produced and selected to assure the best interface resemblance. Colours have also been selected to best match the presumed customer's expectations.

The webpage has been modified to resonate selected colours and a couple of graphs are showing (with fixed data though).

Desktop development are still in a research/tasking phase. Non of us has built interfaces with C# before and we want to make sure that we start with the right environment.

Minimal amount of work has been done on the mobile app.

Communication has worked very good and everyone has taken more responsibility to keep up with the group and tasks.

Quality issues, architecture documents, UI research papers and drafts, and technologic researches have been documented to allow for better understanding of decisions.

What shall be done?

ETL will be 100% completed, tested and active from tuesday to be able to give us an acceptable amount of historical data.
I cannot at this stage specify in detail what tasks will be prioritised regarding interface development. Planning will be done upcoming monday and we are aiming to have prototypes done by next week, and beta versions done in the end of sprint 6.

We are aware of that we will have to work in high pace and are ready for the challenge!
